

VARIABLE SPEED MOTORS

Direct drive cooling tower motor and drive system

For industrial applications

BALDOR · RELIANCE

New direct drive technology

Improves reliability, reduces maintenance, runs quieter and saves energy

By combining the technologies of the field proven and power dense AC laminated frame RPM AC motor with high performance permanent magnet (PM) salient pole rotor designs and the matched performance of an adjustable speed drive, ABB can offer high torque direct drive motors for cooling tower applications. The direct drive solution offers the benefits of variable speed control and eliminates the cost and maintenance required for traditional gearboxes or belted solutions. The fan couples directly to the motor and is controlled by a unique AC drive to provide optimal speed and cooling tower performance that runs quieter with reduced energy consumption. The drive is designed to accommodate the most common industrial communication protocols.

Direct drive RPM AC synchronous PM motor reduces maintenance cost

The RPM AC™ synchronous PM motor uses laminated finned frame construction to provide a highly efficient power dense package with flange mounting dimensions that can replace the right angle gearbox and jack shaft installation in many conventional cooling towers. This same technology is offered in conventional, yet power dense, foot mounted designs that can replace the belt and sheave application where more vertical mounting space is available. Derived from one of the toughest motor platforms used in the most demanding industrial applications, the RPM AC motor is the right solution for operation inside the tower's hot and humid environment. The TEAO (totally enclosed air over) RPM AC cooling tower motor is designed for minimal maintenance. Bearings require lubrication only once per year. Water ingress along the shaft is prevented with the use of an Inpro/ Seal® bearing isolator and a slinger. The electrical insulation system is manufactured using a VPI (vacuum pressure impregnation) process that ensures long motor life even in the most extreme environmental conditions. Condensation drains relieve any moisture that may collect inside the motor. No more changing gear oil, lubricating pillow block bearings or changing out belts.

ABB ACS880 cooling tower drive*

The ABB ACS880 cooling tower drive utilizes our Matched Performance philosophy to ensure trouble-free operation with the Baldor-Reliance

RPMAC Permanent Magnet Cooling Tower Motor Family. The drive also provides custom features for the Cooling Tower Industry including Trickle Current Motor Heating, Locked Motor Rotor functionality to prevent wind-milling when not enabled, De-ice Mode, Accelerometer Feedback and RTD Temperature Feedback. Additionally, much complexity is reduced in the Cooling Tower Drive by removing all of the General Purpose Drive Parameters and only providing the necessary Cooling Tower Drive Parameters, allowing for easy configuration and start-up. The ABB Cooling Tower Drive also provides a Quick Start Assistant specifically for cooling tower applications making start-up simple and straight-forward.

Field tested reliability

After extensive Lab testing, motor and drive systems have been installed and field tested for extended periods of time. One system is running under a controlled environment on one of two identical cooling towers at Clemson University. Both towers were instrumented and the traditional geared system was evaluated against the Baldor-Reliance CT Direct Drive Solution. Each tower had the same 5 blade, 18 foot diameter fan, with pitch and tip clearance adjusted to identical settings. Performance results, which were verified by a third party reduced losses in the system by approximately 50% and provided a measured input kW power savings of 11.8% compared to a traditional geared system, with high speed noise reduction from 82.3 dBA to 74.4 dBA and reduced vibration.

*ACS880 cooling tower drive specified with "+N5350" variant code.

RPM AC direct drive cooling tower

Features and benefits

Direct drive motor

- Eliminates the need for a gearbox, jack shaft, pillow block bearings and couplings
- Reduces maintenance and provides improved reliability
- Eliminates cooling water contamination by eliminating gearbox oil and leakage
- Reduces power consumption
- Results in increased safety due to removal of rotating equipment.
- Water-tight motor design operates in the air stream
- Eliminates the alignment of mechanical components for quicker installation, reduced installation costs and increased system efficiency

Bearings and seals

- Oversized to maintain longer bearing life exceeding L-10 100,000 hours
- Grease lubricated for long life
- Handles fan loads with improved reliability
- Proven Inpro/Seal® bearing isolator
- Only one ingress point
- Insulated opposite drive end bearing on FL440 and FL5800

Adjustable speed control

- Designed specifically for the Cooling Tower Industry and can be set at the optimum speed point (+N5350)
- Sensorless Permanent Magnet motor control operates without an encoder or resolver
- Trickle heating eliminates need for motor space heaters
- Guaranteed Compatibility due to the Matched Performance of the motor and drive
- Allows for a soft start (controlled ramp)
- Saves energy and reduces mechanical stress on the system 30 – 60%
- · Improves system reliability and extends life
- Reduces noise
- Trickle current for braking prevents fan windmilling when not in operation
- System resonance speeds can be bypassed
- +P934 Drive Care Warranty provides a 5 Year Warranty on the Drive with a Preventative Maintenance on the Drive at 3 Years.

Communication protocols

When system automation control and monitoring is a requirement for your cooling tower operation, the ABB Cooling Tower Drive easily communicates with all the Industrial Communication Networks including Ethernet/IP, DeviceNet, Profibus-DP, CANopen, MODBUS/TCP, PROFINET, MODBUS-RTU and EtherCAT.

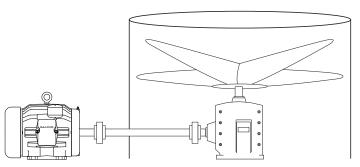

A typical conventional fan drive arrangement of a gearbox mounted under the fan.

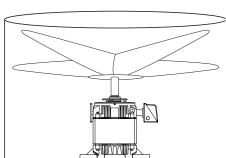

A direct drive motor eliminates many components of a right angle geared system.

Retrofit or new tower designs

RPM AC Cooling tower motors are flange mount designed to be interchangeable with many popular gearbox bolt hole mounting configurations. Shaft height, diameter and flange mounting dimensions can be directly interchangeable with some existing cooling tower gearbox. Higher motor torque ratings are available using taller motors when space is available. Flange mount designs are available in a wide torque range in frame sizes FL250, FL280, FL320, FL360, FL400, FL440, and FL5800

New Direct Drive Tower Design

RPM AC cooling tower motor and drive

Models

We have several stock models available that can fit your application requirements. These models can be selected through the RPM AC Cooling Tower Wizard tool. The RPM AC Cooling Tower Wizard is a comprehensive motor selection tool that allows the user to specify motor parameters.

Motors can be rerated to meet customer specifications or a custom motor can be ordered/specified.

Motor features

- Mounting pad standard on FL58XX Frame Motors
- Mounting pad optional on 440-Frame and smaller motors
- · Thermostats one per phase normally closed
- · Heavy build external coatings
- Proven Inpro/Seal® bearing isolator with slinger umbrella over seal (58XX-Frame Motors Only)
- Proven insulation system technology used in off-shore drilling applications
- Stator RTD standard on FL58XX Frame Motors
- Stator RTD optional on 440-Frame and smaller motors

Tapered shafts are also available. Typical taper is 1/2" per foot. Special non-standard shaft requirements must be defined on

Optimized cooling tower performance

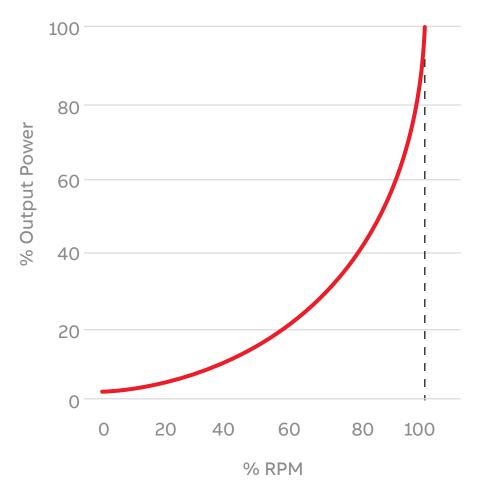

Energy savings even under low load conditions

By optimizing motor speed considerable energy can be saved. The entire cooling tower system must be designed for the "Worst Case" (or highest air flow) scenario. For optimum system performance the fan may need to operate at reduced speed.

As the speed of the motor is decreased, the air flow drops in a corresponding linear fashion. So, for example, if the motor runs at only 50% speed, the air flow is correspondingly reduced to 50% of maximum air flow.

However, the input power to the motor varies with the cube of the motor speed. For example, if a motor is run at half-speed, the power consumed by the motor is 12.5% or 1/8 [i.e. $(\frac{1}{2})^3$] of the power consumed at full speed. So, if the needed airflow can be achieved by running at half-speed, it is possible to save a large amount of energy (see energy chart below).
